

Deal Prep & Discovery Intelligence

Workshop Demo Brief

From account research to discovery, structured requirements, solution hypothesis, and proposal generation

Hussain, for this week, can you help me prepare a demo for a workshop? I want to show people how to do Deal Prep & Discovery Intelligence end-to-end.

Demo Flow

1. Before the Call: Deep Account Research

The user provides:

- Company name or URL
- Target contact

The system researches:

- What the company does
- Business model
- Company size
- Locations / markets served
- Recent news
- Hiring activity
- Leadership
- Products / services
- Competitors
- Likely tech stack
- Relevant strategic initiatives
- Public pain signals

Output: a concise Account Brief that gives the seller the context they need before the meeting.

2. Before Discovery: Call Prep

Important: the system should not just summarize the company. It should turn research into a point of view for the discovery call.

- Likely business priorities
- Hypotheses about operational pain
- Likely reasons they may need software
- Questions we should not waste time asking because the information is already public
- 5-10 discovery questions specific to that company
- Likely objections
- Potential project wedges
- Relevant prior work / case studies to mention
- Things to listen for during the discovery call

Goal: go into the call with an informed point of view rather than starting discovery from zero.

3. After the Call: Transcript Structuring

After discovery, the transcript gets uploaded. The system converts the conversation into structured information.

Business Context

- Company situation
- Why they are exploring this
- Current process

Problems

- Pain point
- Impact
- Frequency
- Who experiences it

Requirements

- Must-have
- Nice-to-have
- Future requirements

Users

- User types
- Approximate counts
- Permissions / roles

Workflow

- Current state
- Desired state
- Handoffs

Commercial

- Budget signals
- Timeline
- Urgency
- Procurement requirements

Stakeholders

- Champion
- Decision-maker
- Technical approver
- Potential blockers

Risks / Unknowns

- Unresolved requirements
- Dependencies
- Missing information

4. Follow-Up Question Generation

Once the transcript is structured, the system should identify what was not answered during discovery and generate the questions needed before an accurate proposal can be created.

- User count was never confirmed
- API availability is unclear
- Decision-maker was not identified
- Budget was not discussed
- Timeline is ambiguous
- Integration requirements need clarification

5. Solution Hypothesis

Based on everything learned during discovery, the system generates:

"Here is what we think should be built."

- Recommended architecture
- Major modules
- Workflows
- Integrations
- User roles
- Milestones
- Phase 1 vs. future phases

6. Proposal Generation

At this point, the system should have enough structured information to create a proposal.

- Executive summary
- Understanding of the problem
- Proposed solution
- Scope
- Milestones
- Timeline
- Exclusions
- Assumptions
- Pricing inputs
- Next steps

The Before vs. After Story

Current Process	New Process
Google company	Company
Read LinkedIn	Research brief
Search recent news	Discovery plan
Write discovery questions manually	Call transcript
Take messy meeting notes	Structured requirements
Read the transcript afterward	Missing questions
Try to remember requirements	Solution architecture

Write scope	Scope
Write proposal	Proposal
Realize something was missed	
Email the prospect again	

Simplified flow: Company -> Research Brief -> Discovery Plan -> Call Transcript -> Structured Requirements -> Missing Questions -> Solution Architecture -> Scope -> Proposal

Demo Objective

The demo does not need to be production-ready. The goal is to create a polished end-to-end workflow that can be shown during a workshop to demonstrate how AI plus custom software can improve the entire discovery-to-proposal process.
